The natural body

By Naomi Pire

The power of social media

The shoulder blades are a part of the body's structure that supports the entire body. They are the points where the arms, shoulders, and back meet. This intricate system is responsible for a wide range of movements, from lifting heavy objects to raising your arms to stretch. The shoulder blades play a crucial role in maintaining the balance and stability of the body, allowing for effective movement and providing a stable foundation for the upper body's structure.
